# Overview - WITTENSTEIN group

## WITTENSTEIN AG

The **WITTENSTEIN AG**, with its 750 employees worldwide, develops, produces and distributes high-precision planetary gears, entire electro-mechanical drive systems, as well as AC servo systems and motors, amongst other products. Areas of application include industrial robots, machine tools and packaging machines, paper and printing machines, elevators, the Formula 1, as well as the aerospace industry.

Technological competence and ongoing innovation ensure the success of the **WITTENSTEIN AG**. Creative and motivated employees are the basis of the company's acclaim. In the past two fiscal years, more than 200 new employees have joined the company. The turnover yielded by products that are less than 5 years old amounts to approx. 85 percent. Every tenth Euro is invested in research and development, more than 12 percent of the employees work in these fields.

Technical solutions: Customer benefit in the foreground

### alpha getriebbau GmbH

Low-backlash servo gears, planetary windlasses with integrated servo drives, as well as the servo design software cymex®.

### WITTENSTEIN

#### motion control GmbH

Integrated electro-mechanical, rotative and linear servo systems. Intelligent units with the highest precision and dynamics.

### WITTENSTEIN

#### cyber motor GmbH

Development and distribution of mini AC servomotors for industrial applications.  
Characteristics: Highest power density and reliability.

Company premises in Igelsheim/Harthausen: Inspiration for innovation

750 motivated employees: Enthusiasm and emotion

### **WITTENSTEIN intens GmbH**

Development, manufacture, sale and distribution of intelligent, innovative implants for orthopedic and accident surgery.

### **WITTENSTEIN bastian GmbH**

Development, manufacture, sales and distribution of innovative gear technology.  
Implemented in, for example, the Formula 1 and the aerospace industry.

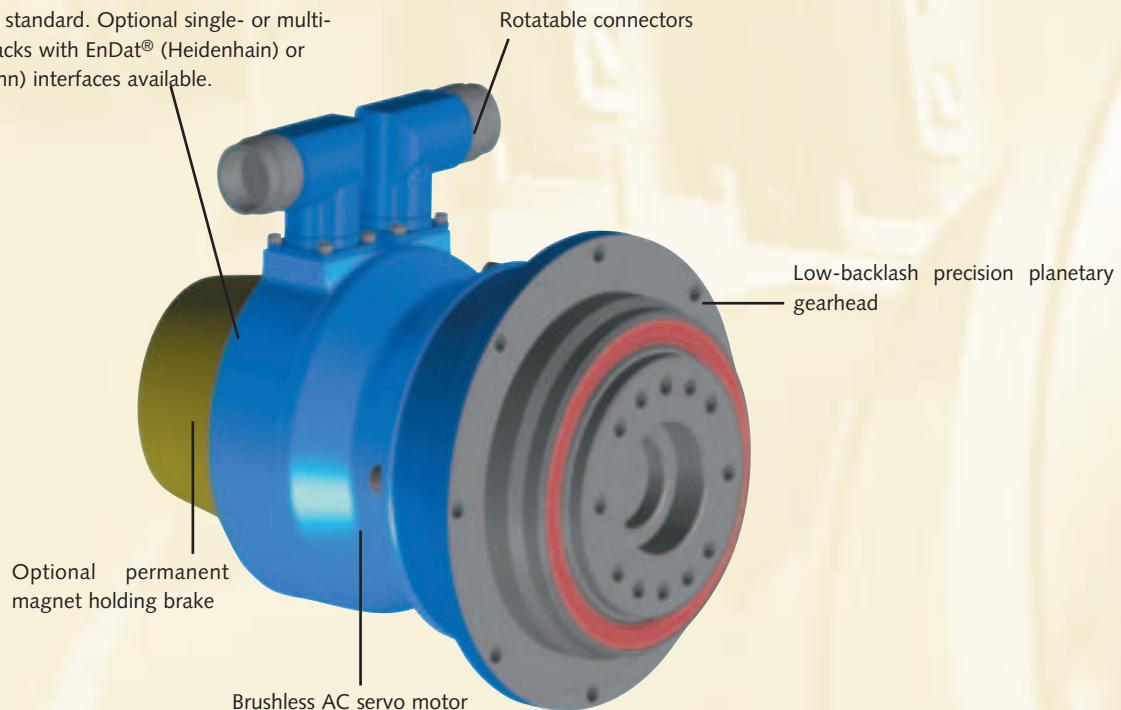

### **WITTENSTEIN aerospace & simulation GmbH**

Development, manufacture, sales and distribution of electro-mechanical control systems, active control units for aeronautical applications and haptic systems with force feedback for simulators.

# Product features

With the TPM and TPMA AC servo actuators, the **WITTENSTEIN motion control** GmbH is providing the drive technology market with products that set new standards in precision, dynamics, power density and compactness.

Resolver feedback is standard. Optional single- or multi-turn absolute feedbacks with EnDat® (Heidenhain) or Hiperface® (Stegmann) interfaces available.

TPM 004 up to 40 Nm

TPM 010 up to 100 Nm

TPM 025 up to 300 Nm

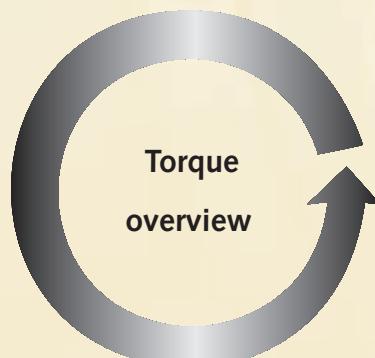

TPMA 025 High Torque up to 480 Nm

TPM 050 up to 650 Nm

TPMA 050 High Torque up to 950 Nm

TPM 110 up to 1600 Nm

TPMA 110 High Torque up to 2600 Nm

# Product features

## High dynamic performance

An integral brushless AC servomotor was designed to work with the alpha planetary gearheads to provide a high torque-to-inertia ratio, optimized for high dynamic performance. Connecting the motor to the gearhead without a coupling improves the stiffness of the unit while reducing the moment of inertia by approximately 40% compared to customary motor/gearhead units.

## High power density

A high pole count motor optimizes use of the magnetic material and yields the most power in the smallest package. In the new 3-stage TPMA version, the torque range has been considerably extended while maintaining the same compact design.

## Compact design/reduced weight

Integrating the servomotor and gearhead into one package sets new standards for reduced size and weight. It is approximately 62% shorter and weights much less than a traditional motor/gearhead combination of comparable power. This is especially important for applications where mounting space is limited or where the motor itself is part of the moving load, e.g. robotics and gantries.

## High positioning accuracy/efficiency

Directly mounting the drive elements to the output flange reduces overall size and provides high torsional rigidity and short settling times. The pinion is integrated directly into the motor shaft, resulting in a much shorter motor-to-pinion distance. This design results in much higher positioning accuracy - <1 arc minute of backlash - and higher dynamics, for shorter cycle times and reduced production costs for the customer application. In addition, the TPM/TPMA feature overall efficiency >85%.

## Direct mount/reduced components

The TPM/TPMA can be mounted from either the front or the rear of the mounting flange. The application load mounts directly to the driving flange, eliminating the need for a coupling. Dual tapered roller bearings in the output stage (from size 050) eliminate the need for additional support bearings in the customer application. In addition, two swiveling connectors allow for easy cable routing.

## Maintenance free

High quality synthetic lubricants provide lubrication for the service life of the product.

## Smooth motion and quiet operation

The TPMs are characterized by low torque ripple for extremely smooth operation. They feature low noise levels of less than 65 dB(A).

## Simple integration

The TPM can be operated with most of the brushless servo controllers on the market. Preassembled cables and controller-specific start-up instructions simplify installation and start-up.

## Optional absolute feedback

An optional single- or multi-turn absolute encoder eliminates the necessity for homing on start-up.

# Applications

Yxlon

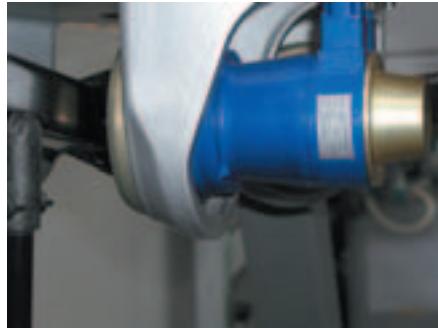

Six TPM drives on two swivel axes and one rotating axis control an X-ray testing system for cast parts. A move to a new position and an X-ray inspection occur within one second, repeating up to 300 times per part. The rapid positioning and testing procedure requires short settling times, which are achieved because of the low weight, high torsional rigidity and low inertia of the TPM drives.

Unicor

A winding unit without dancer roll forms the terminating unit of an extrusion machine for 2-5 mm wide plastic strips. Constant tension is required for smooth winding of the stripes. The high torsional rigidity and excellent dynamics of the TPM drive enables rapid torque regulation, within an torque-adjustment range of 1:40.

SIG Robotics

Three TPM drives control the movement of the three axes of this fast pick and place robot, with up to 120 pick and place cycles per minute. The TPM was chosen for this application because of its high dynamic performance, low weight, small overall length and high reliability.

Installed in a plant for dosing liquid products, three TPM drives control the piston dosing pump, a rotary valve and the container-lifting device. Because of its compact design, three TPM drives are incorporated into a 50 cm x 50 cm x 75 cm space.

| Direction of rotation                                  |       | motor and gearhead in same direction            |
| Insulation class                                       |       | F   |

1) 1000 cycles per hour

2) Permissible 1000 times during the life span of the gearhead

3) At 20°C ambient temperature

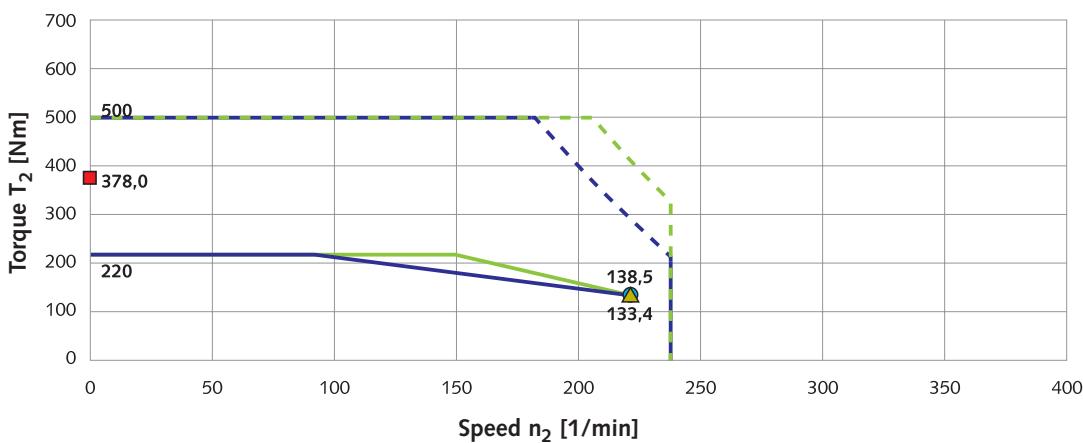

4) Based on the flange center

5) At 20°C gearhead temperature

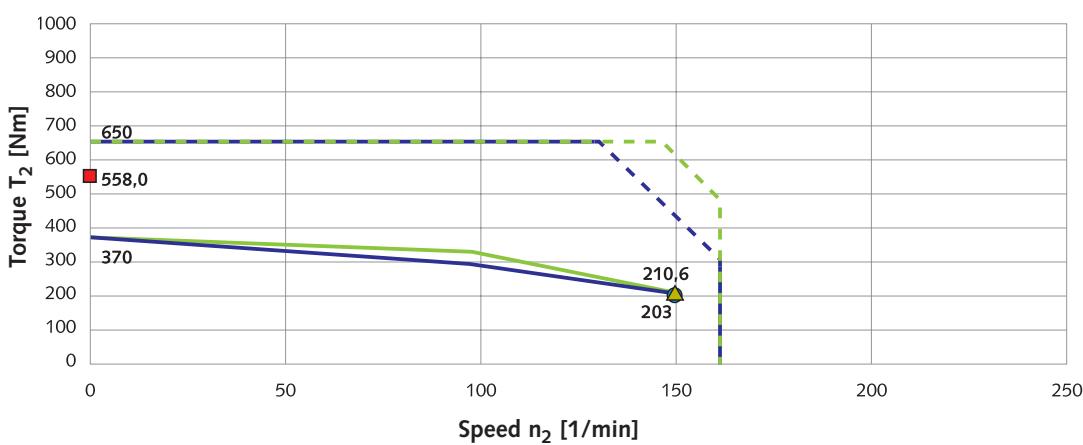

6) Limit motor values to maximum values of the gearhead

The maximum and nominal values of the gearhead can limit the output values in some circumstances.

# Options

## Electrically-released holding brake

A compact permanent-magnet brake is available for holding the rotor when the power is off. It is characterized by backlash-free operation, drag-free when disengaged, unlimited ON time and constant torque at high operating temperatures.

## Temperature sensors

The following temperature sensors are available with various servo controllers. They measure temperature directly at the motor coil.

- PTC - Positive temperature coefficient thermistor
- KTY - Linear temperature coefficient thermistor
- NTC - Negative temperature coefficient thermistor

## Feedback systems

Various feedback systems are available for position encoding.

A single turn brushless resolver feedback is standard for TPM. This robust feedback device is suitable for many applications with normal demands for smooth running and precision.

For higher technical demands, optical encoders are available from Heidenhain and Stegmann. Using the EnDat® and Hiperface® interfaces, position values as well as information regarding startup and drive data can be stored to and retrieved from the TPM.

See page 46 for the respective pin assignments.

# Accessories

## Cables

Matching signal and power cables for the tested servo controllers listed on page 45 are available.

Please supply the following data when you order:

- Complete TPM description
- Desired length of cable, in 5 meter increments.
- Exact type description of servo controller to be used

The cables have excellent quality:

- Suitable for cable tracks, because highly flexible wires in accordance with DIN VDE 0295, class 6
- Oil and fire proof
- Free of halogen, silicon and CFC

## Mechanical characteristics:

|                                   |   |
|-----------------------------------|---|
| Max. tensile strength             | Static 50 N/mm <sup>2</sup> conductor diameter<br>Dynamic 20 N/mm <sup>2</sup> conductor diameter |
| Max. permissible torsion          | ± 30°/m   |
| Permissible operating temperature | Static: -50°C to +80°C<br>Flexed: -20°C to +70°C  |
| Min. permissible bending radius   | 10 x D (outer diameter of cable)<br>k)  |
| Number of bending cycles          | 5 million (at bending radius 10 x D)  |
| Max. permissible acceleration     | 5 m/sec <sup>2</sup>  |
| Max. permissible speed            | 180 m/min   |

| k)           |   | D                  | conductor diameter  |
|--------------|---|--------------------|---|
| Power cable  | TPM 004 - TPM(A) 050 (i=61, 91, 110, 220)<br>TPM 050 (i=21, 31), TPM(A) 110 | 12,2 mm<br>15,1 mm | 4 x 1,5 mm <sup>2</sup> + 2 x 0,75 mm <sup>2</sup><br>4 x 2,5 mm <sup>2</sup> + 2 x 1 mm <sup>2</sup> |
| Signal cable |   | 10 mm              |   |

# Servo controller

The TPM/TPMA AC servo actuators can be operated with a wide variety of servo controllers. The subsequent table listed all tested controllers with information on the correct option choices, feedbacks, temperature sensor and DC bus voltage.

For a number of these, a written startup manual is available. It contains all relevant parameter settings of the respective manufacturer to ensure that the startup can be performed in the shortest possible time.

| Manufacturer  | Series/type             | feedback device |             |                 |                     | Temperature sensor |     | DC bus voltage |         | Cannot be implemented with TPM ... |
|---|-------------------------|-----------------|-------------|-----------------|---------------------|--------------------|-----|----------------|---------|------------------------------------|
